TYPES OF BACKUP

01

FULL BACKUP

- A full backup involves the creation of a complete copy of an organization's files, folders, server data and hard drives.

PROS

- Provides full copy of dataset
- Offers the best protection

CONS

- Very time consuming
- Requires more storage space

02

INCREMENTAL BACKUP

- An incremental backup will only copy data that has changed since the last backup.

PROS

Takes minimal time to backup

Requires less storage space than full backup

CONS

Time consuming to restore

Need all the backups in backup chain to restore

03

DIFFERENTIAL BACKUP

- Similar to an incremental backup, a differential backup copies all data changed since the last full backup.

PROS

Can back up changed data to the same convenient location as all new data.

CONS

Requires more time and space to complete.

OTHER BACKUP TYPES

SYNTHETIC FULL

- In a synthetic full backup, backup software takes the previous full backup and all the incremental backups that are created over a set period of time and combines them into a new full, synthesized backup.

FOREVER FORWARD INCREMENTAL

- Forever forward incremental method keeps one full backup file on disk, and then only incremental backups afterwards.

REVERSE INCREMENTAL

- In this type of method, increments are injected into full backup files, so the latest backup file is always a full backup of the most recent backup.
